

Why InBill?

Margin control and reduced revenue leakage

Quick and effective implementation

Detailed record information to win more interconnect settlement disputes

Ability to analyze and optimize network routing

Minimal cost and flexible implementation solutions — no additional software required

Full and complete charging and efficient call case management

Highly scalable — interconnect billing for the smallest to the largest network operators.

A highly accurate and cost-effective interconnect, CABS and content settlement software solution built for today's market.

Maximize the Value of Your Network

Capturing the Details

The financial value of an operator's network is reliant on every event record being processed efficiently, accurately and cost-effectively.

The best way to assure this is through greater visibility. Capturing raw data as it travels through the network is the only way to guarantee full knowledge of every transaction — providing more accurate billing and better dispute resolution, as well as valuable marketing feedback.

InBill represents network activity in financial terms - critical for an effective interconnect, CABS and content settlement product. InBill provides the platform for other telecommunications software solutions as well, such as fraud detection, network auditing, revenue assurance, best-cost routing and other network analysis and management tools.

Redknee's Solution

InBill delivers an extensive level of detail on your network traffic and settlement issues, and can handle the most complex interconnect agreements.

Redknee InBill provides the detail needed to maximize billing accuracy and win interconnect disputes.

Redknee InBill has been developed to be the most accurate and cost-effective interconnect, CABS and content settlement software solution in today's market — whether in Europe, North America, Africa or the Asia Pacific region.

InBill
delivers
value in
detail.

Reference Data Maintenance

Redknee InBill has been specifically designed to support the detailed and often extensive changes to your interconnect billing and content data.

InBill's module system allows you to make changes directly into the system. It utilizes a unique quality checking system that allows new data to be entered into a temporary database and checked before transferring into the InBill Rating engine, thus ensuring the integrity of your data.

Event Case Generator

InBill provides you with an innovative and effective solution to manage the many varied traffic scenarios crossing your network. InBill enables you to define your own event cases whenever you need them. For example, the first step is to define your event case with details such as switch type, network and connecting networks, and service number type. Once an event case has been established, various rates can be applied according to your existing interconnect agreements or as determined by regulatory bodies. InBill's simple, two-step process allows you to manage and rate new products, services and agreements quickly and easily.

Rating

Rating and settlement are complex processes that go straight to the heart of interconnect and content partner relationships and therefore can affect the entire operation of your company. Redknee's InBill provides a sophisticated rating engine that enables you to apply business logic to determine traffic classifications and apply the correct rates - *efficiently and accurately*.

Re-Rating

There will always be last minute changes or corrections to interconnect pricing and agreements. Redknee is aware of how complex your interconnect and content rating can be, so it offers a solution that enables you to modify pricing while taking into consideration your rating schemes on a per-event basis. InBill also provides you with a detailed and accurate audit trail for any re-rating activities.

Reporting

InBill delivers reports not only for business management, but to meet your regulatory requirements as well, with the added convenience of access through a web interface. Hyperlinks are also used to allow you to drill-down through your reports to give you the specific and detailed information you require. InBill also provides user reporting, giving you the ability to develop your own queries. This gives you access to your data - *anytime, anywhere, in detail*.

Network Agnostic

InBill works in conjunction with any type or combination of direct network or mediation interface. Redknee InBill receives the raw records from a variety of sources and processes them into a common format. You have one system and one set of hardware completing the entire task. This means that you can continue to use whatever network and mediation solutions you already have in place, providing a shorter implementation period and lower costs.

*Redknee InBill gives you access
to your data - anytime, anywhere,
in detail.*

InBill supports all telecommunications networks, including:

- Mobile (GSM, CDMA, AMPS)
- Standard telephony (fixed)
- VoIP
- Internet services
- NGN broadband services
- Transit traffic
- Intelligent network services
- Data traffic
- IP
- GPRS/WAP
- 2.5G/3G
